

### **ABSTRACT**

**[00078]** A system and method is provided to verify configuration of a client access device requesting access to a network by establishing a communications link between a network access system and the client access device to authenticate and authorize the client access device and a user associated with the client access device. The network access system further receives client device configuration data from the client access device over the communications link during an authentication and authorization exchange and processes the client device configuration data to determine if the client access device will be granted access to the network.
